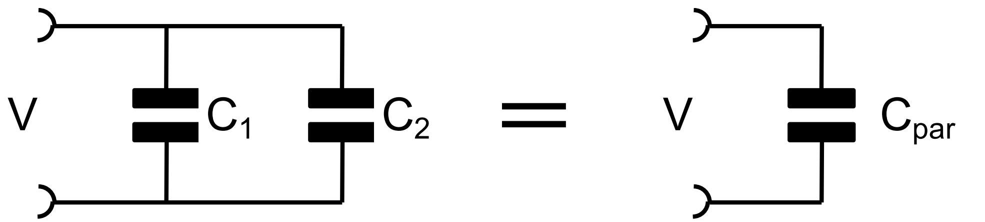
Exercise:
Thévenin, Resistors, Capacitors

Prof. Dr. P. Fischer

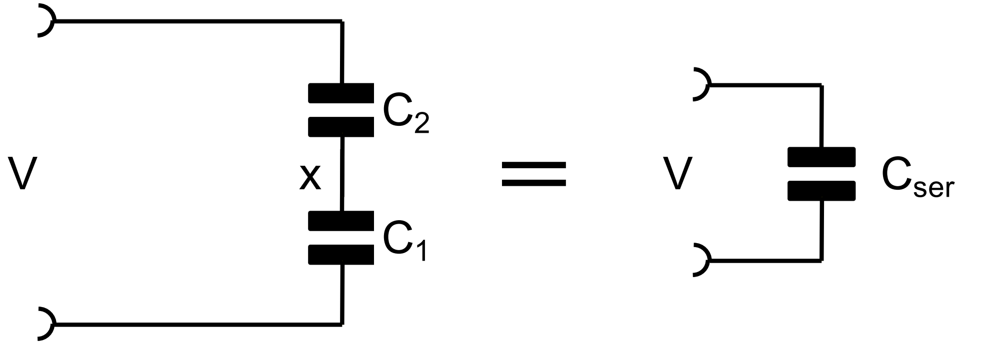
Lehrstuhl für Schaltungstechnik und Simulation
Uni Heidelberg

Exercise 1

- Derive the expressions for the series and parallel connection of capacitors
- Use charge conservation (at node x)

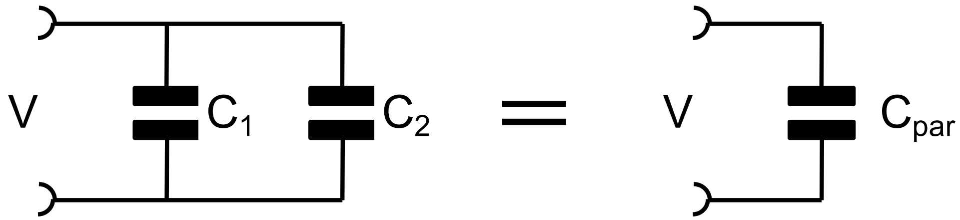


C_{par} = ???



C_{ser} = ???

Solution 1



$C_{par} = ???$

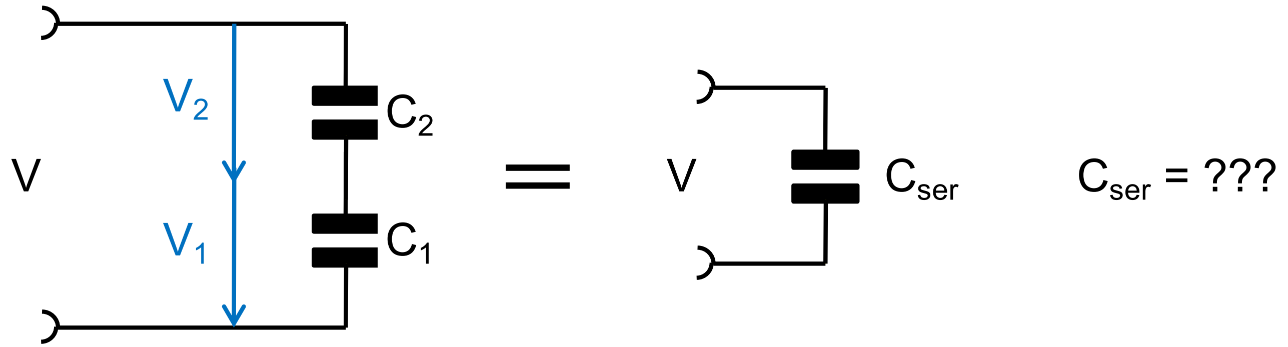
1. Charge conservation:

$V \times C_1 + V \times C_2 = Q_1 + Q_2 = Q_{par} = V \times C_{par} \quad \rightarrow \quad C_1 + C_2 = C_{par}$

2. Kirchhoff & complex impedance:

$V\, sC_1 + V\, sC_2 = i_1 + i_2 = i_{par} = V\, sC_{par} \quad \rightarrow \quad C_1 + C_2 = C_{par}$

Solution 1



1. Charge conservation:

Note: no charge can 'escape' the middle node, so that $Q_1=Q_2=Q_{ser}$

$V = V_1 + V_2 = Q_1/C_1 + Q_2/C_2 = Q/C_1 + Q/C_2 = Q/C_{ser}$

$\rightarrow \quad 1/C_1 + 1/C_2 = 1/C_{ser}$

2. Kirchhoff & complex impedance:

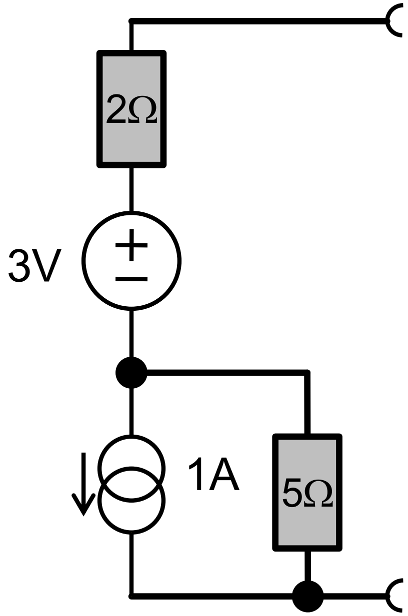
$V_1\, sC_1 = V_2\, sC_2$ and $V_1 + V_2 = V \quad \rightarrow \quad V_1 = V\, C_2 / (C_1+C_2)$

$\rightarrow \quad i_1 = V_1\, sC_1 = V\, s\, C_1C_2 / (C_1+C_2)$

$\rightarrow \quad C_{ser} = i / (Vs) = i_1 / (Vs) = C_1C_2 / (C_1+C_2)$

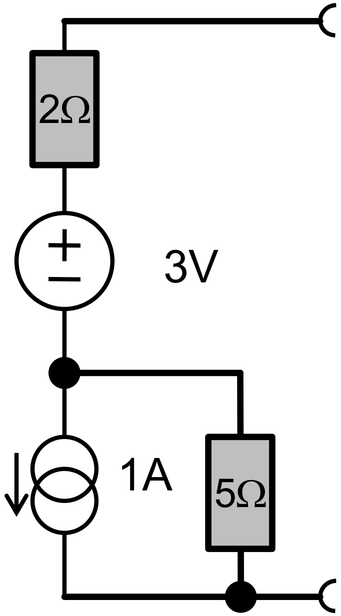
Exercise 2

- Derive the Thévenin Equivalent for the following circuit:



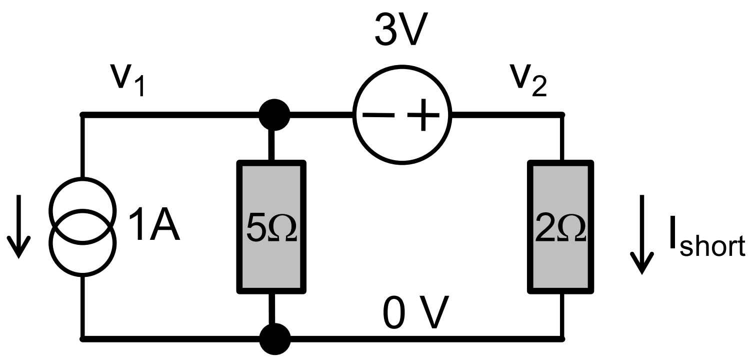
- Try two different methods:
  - Use the Open/Short method with Kirchhoff's rules
  - Convert the I-source part to a voltage source first…

Solution 2 – Kirchhoff



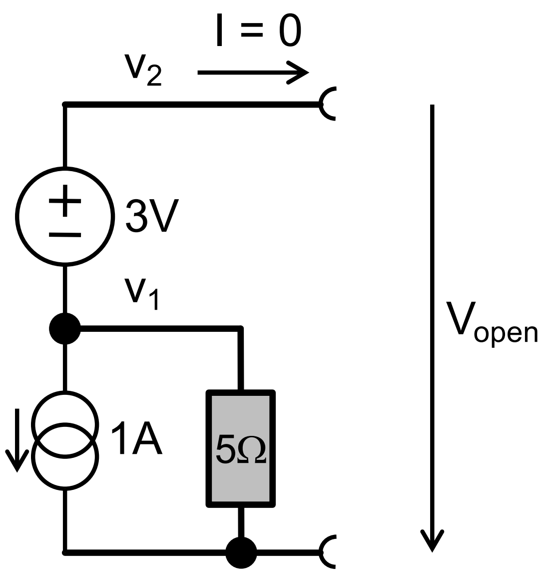
1. Short circuit current:

- EQ1: 1 A + v_1 / 5Ω + v_2 / 2Ω = 0
- EQ2: $v_2 = v_1$ + 3V
- → v_2 = - 4 / 7 V
- → I_{short} = - 2 / 7 A



1. Open circuit voltage:

- EQ1: 1 A + v_1 / 5Ω = 0
- EQ2: $v_2 = v_1$ + 3V
- → v_1 = - 5 V
- → v_2 = V_{open} = - 2 V

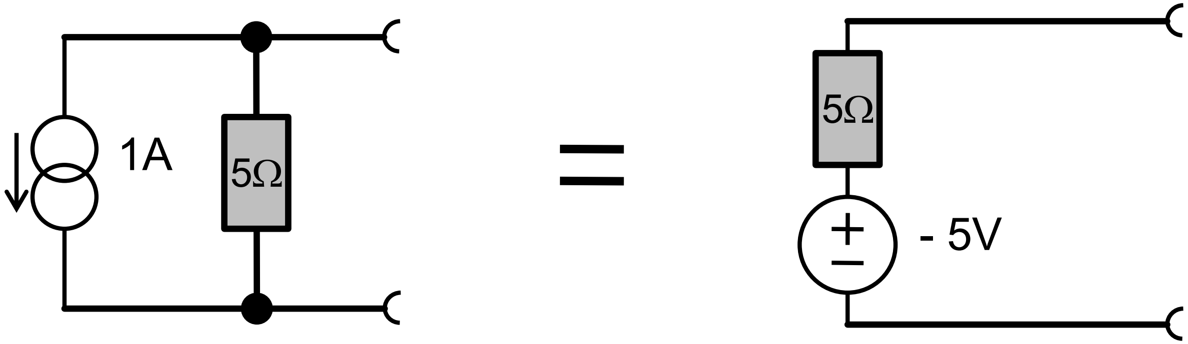


- Source: $V_0 = V_{open}$ = - 2 V, $R_V = V_0 / I_{short}$ = 7 Ω

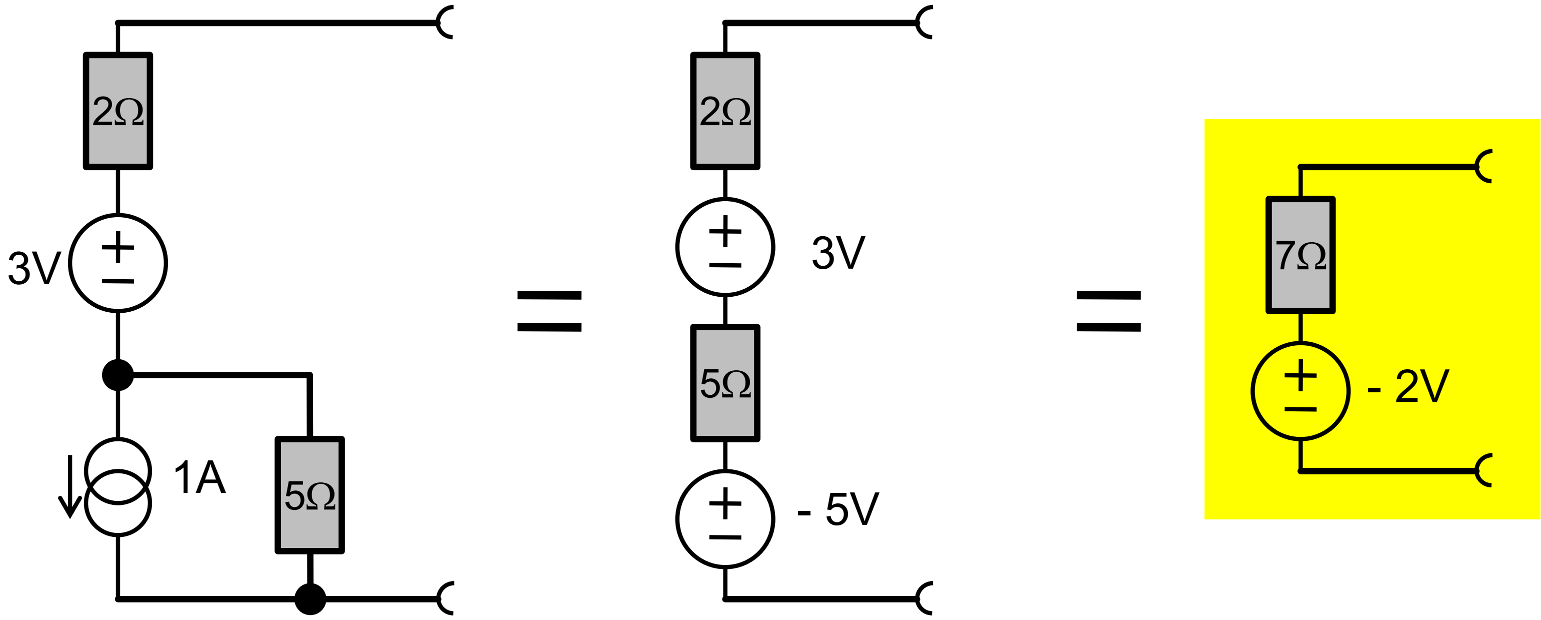
RUPRECHT-KARLS-
UNIVERSITÄT
HEIDELBERG

Solution 2 – Thévenin Transformations

1. Convert the current source to a voltage source:

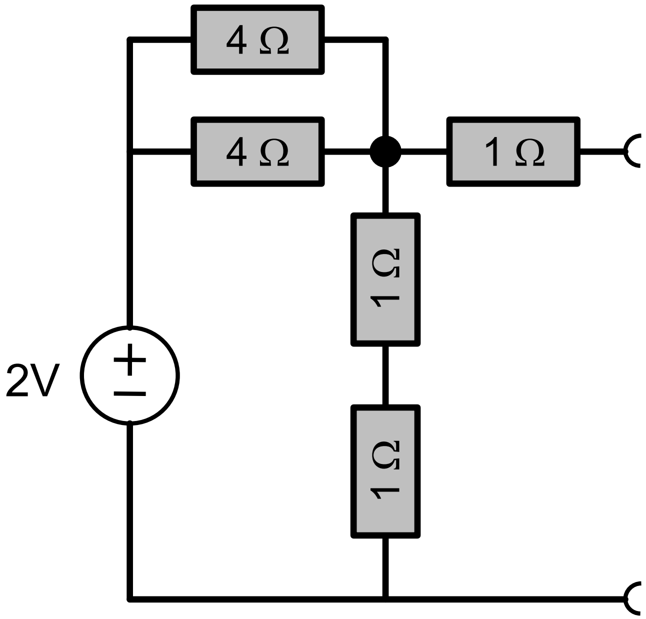


2. Use this in the circuit:



Exercise 3

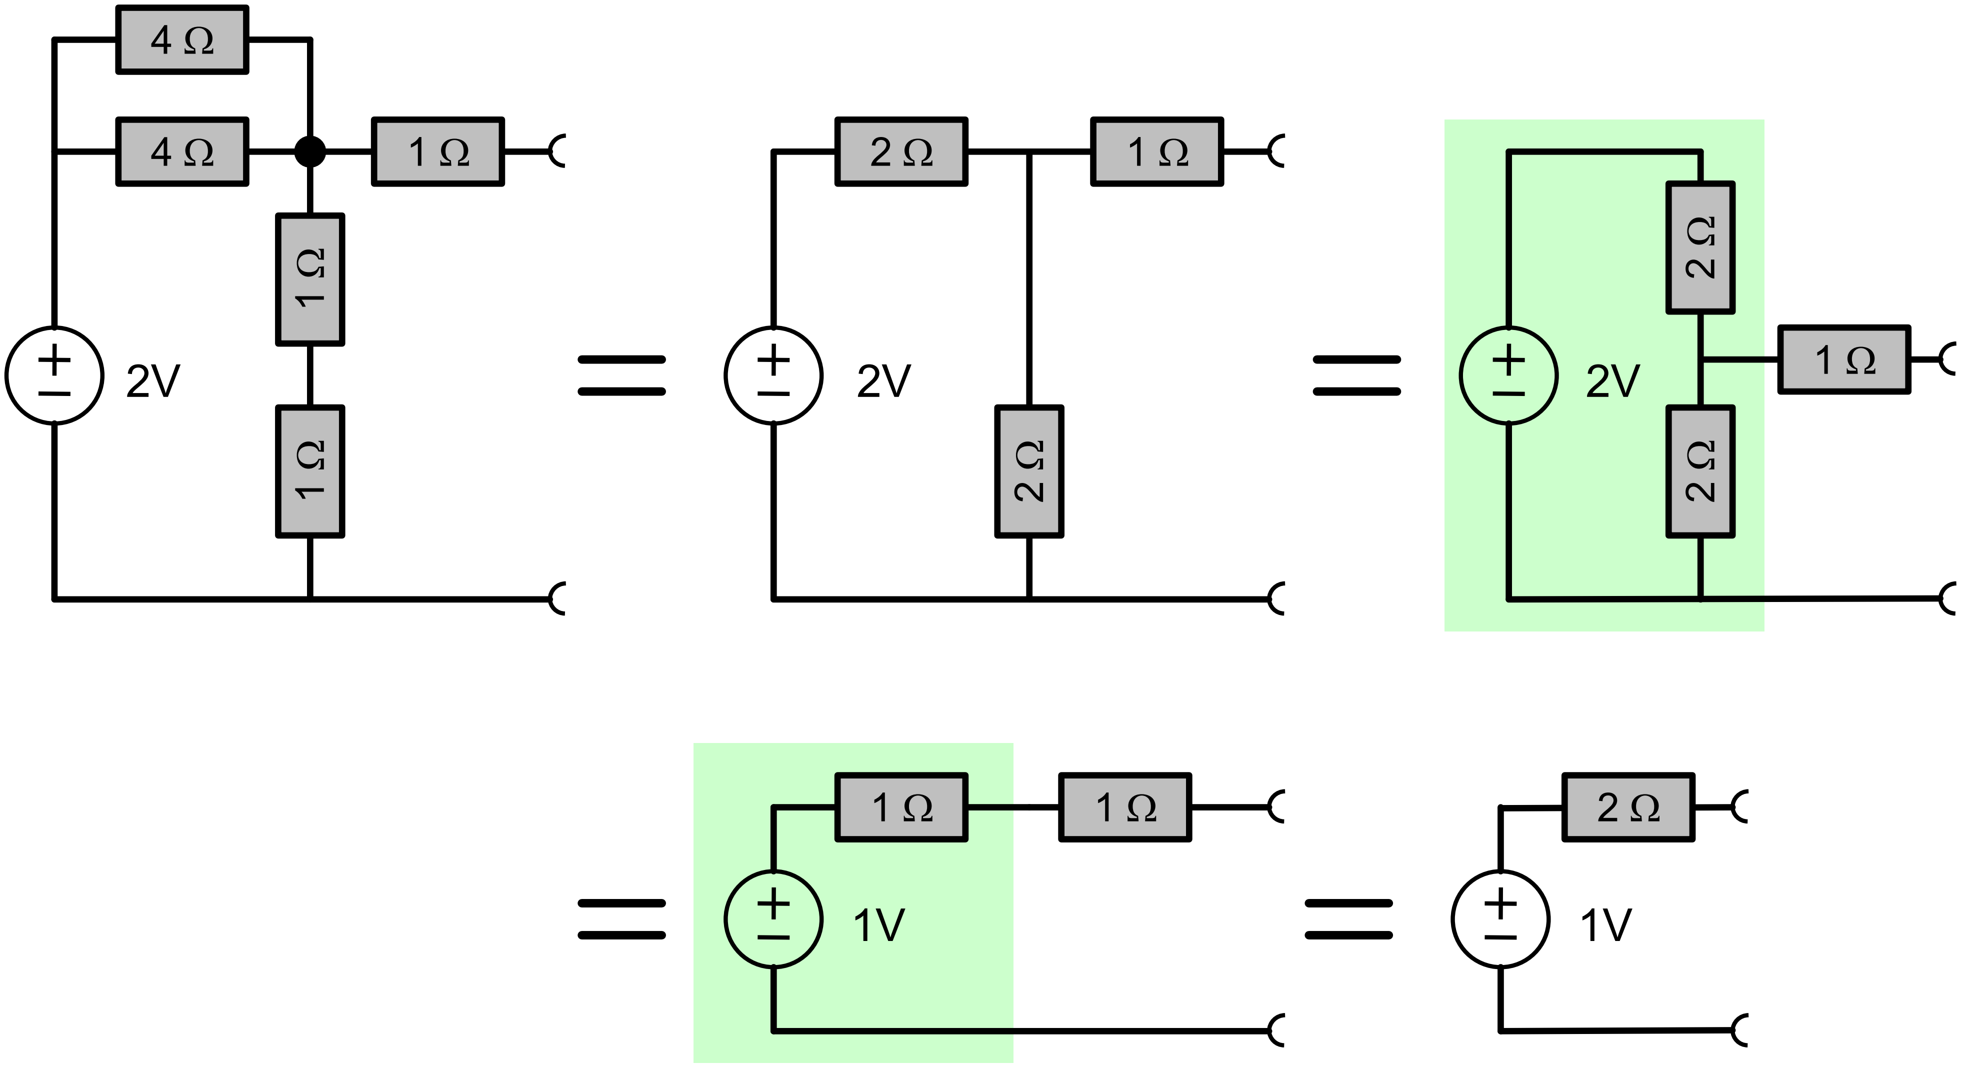
- What is the Thévenin Equivalent of the following circuit?



- Use two methods to find the result:
  - parallel / series connection of resistors and your knowledge about the voltage divider
  - short/open method

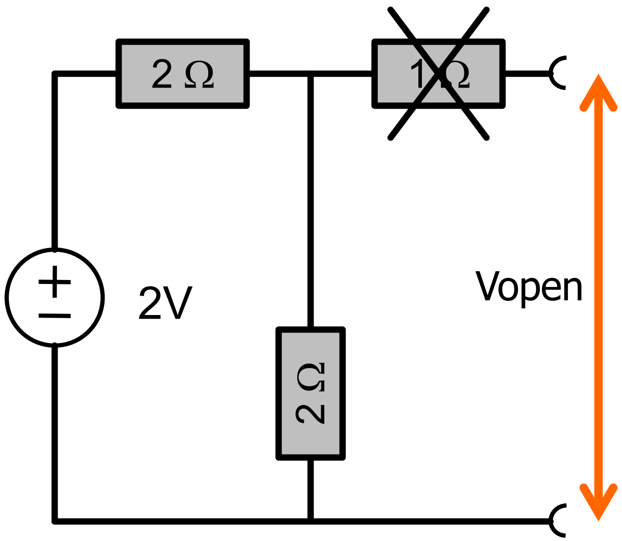
Solution 3

- Parallel-Series Connection, Voltage Divider:

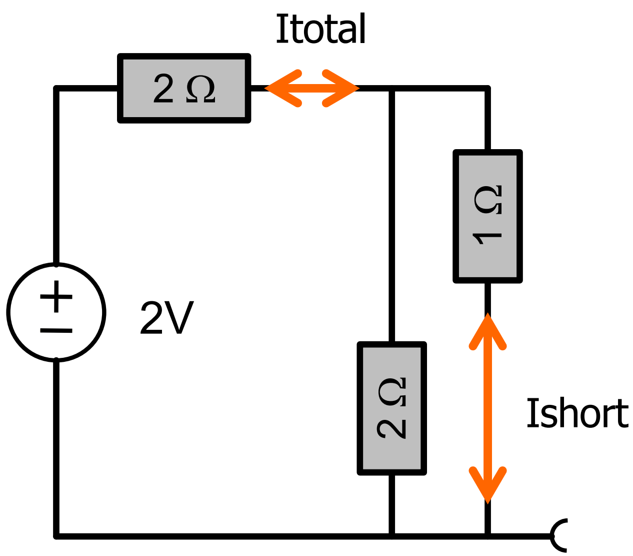


Solution 3

- Open: Vopen = 1V



Short:



Rtotal = 2Ω + 2/3Ω = 8/3 Ω

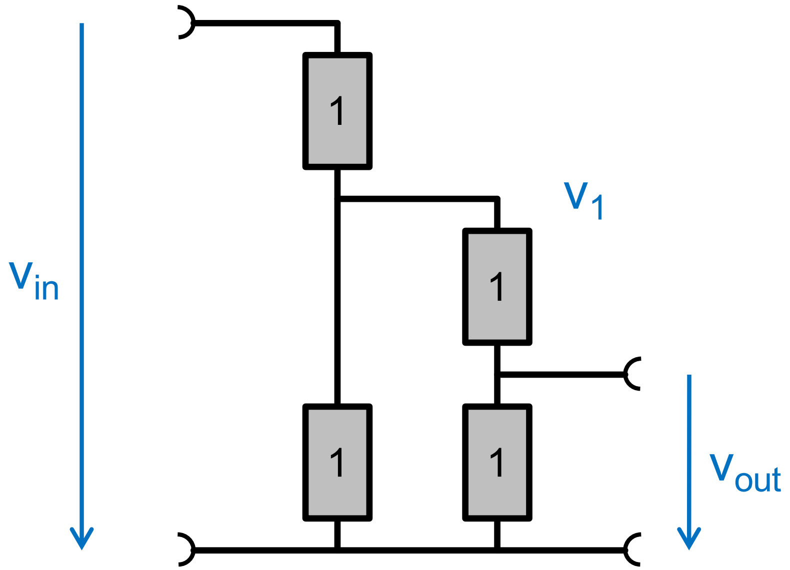
Itotal = 2V / Rtotal = 3/4 A

Ishort = 2/3 Itotal = 1/2 A

Zin = Vopen / Ishort
= 1V / ½ A
= 2 Ω

Exercise 4

- What is the 'gain' (attenuation) of the following voltage divider (all resistors have 1 Ohm):



- Try two different methods:
  - Your knowledge of parallel / serial connection of resistors
  - Kirchhoff's law

Solution 4

1. ‘By hand’:
   - The lower part is a *parallel* connection of 1Ω and 2Ω.
     This gives $(1/1\Omega + 1/2\Omega)^{-1} = 2/3\ \Omega$.
   - So we have at node v1 a voltage divider with 1Ω and 2/3 Ω.
     The voltage at v1 is (2/3) / (1+2/3) vin = 2/5 vin
   - The voltage at vout is half of v1, so vout = 1/5 vin
2. Kirchhoff
   - We have current equations at nodes v1 and vout:

$$\text{EQv1} = \frac{\text{vin} - \text{v1}}{1} == \frac{\text{v1}}{1} + \frac{\text{v1} - \text{vout}}{1};$$

$$\text{EQvout} = \frac{\text{v1} - \text{vout}}{1} == \frac{\text{vout}}{1};$$

```
Eliminate[EQv1 && EQvout, v1]
```

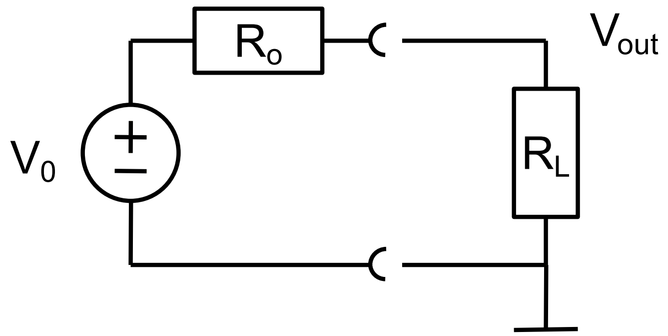
5 vout == vin

```
First@Solve[%, vout]
```

$$\left\{\text{vout} \to \frac{\text{vin}}{5}\right\}$$

Exercise 5

- A voltage source with voltage V_0 and output resistance R_0 is loaded by a resistor R_L:



- What is the output voltage V_{out} ?
- Which current flows in R_L ?
- What power (P = U I) is dissipated in R_L ?
  - Check that noting is dissipated for $R_L=0$ and $R_L \rightarrow \infty$
- For which value of R_L is the dissipation maximized?
  - What is the dissipation?

Solution 5

In[29]:= Vout = V0 $\frac{RL}{R0 + RL}$;

In[30]:= Iout = $\frac{Vout}{RL}$

Out[30]= $\frac{V0}{R0 + RL}$

In[31]:= Pout = Vout Iout

Out[31]= $\frac{RL\ V0^2}{(R0 + RL)^2}$

In[38]:= Table[Limit[Pout, RL → x], {x, {0, ∞}}]

Out[38]= {0, 0}

In[39]:= Solve[D[Pout, RL] == 0, RL] // First

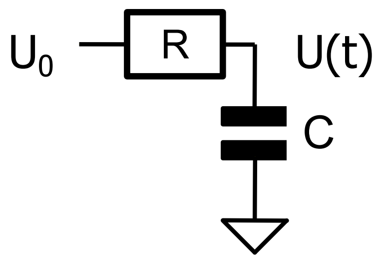
Out[39]= {RL → R0}

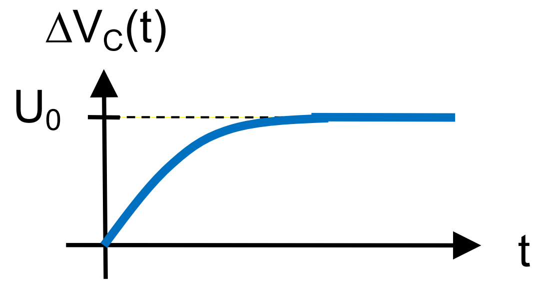
In[40]:= Pout /. %

Out[40]= $\frac{V0^2}{4\ R0}$

Exercise 6

- We consider charging of a capacitor C though a resistor R to a voltage U_0.





- Show that $U(t) = U_0 - U_0 \, e^{-\frac{t}{RC}}$ satisfies the differential equation
- Simplify U(t) for small times t<<RC.
- What is the initial slope ?
- Derive this slope directly (assuming U(0) = 0).

Solution 6

- For a capacitor, we have dU/dt = I/C.
  And we have I = $(U_0\text{-}U)/R$
  So the DGL is $U'(t) = (U_0\text{-}U)/RC$
- The proposed solution $U(t) = U_0\text{-}U_0 \text{ Exp}(-t/RC)$ gives
  The left hand side: $U'(t) = U_0/RC \text{ Exp}(-t/RC)$
  And the right side: $U_0 \text{ Exp}(-t/RC) / RC$, i.e. the same.

- For small x, the Exp(x) is ~ 1+x, therefore
  $U(t) \sim U_0\text{-}U_0 (1\text{-}t/RC) = t\, U_0/RC$
- The slope is derivative of this, i.e U_0/RC
- This is a charging I/C with an initial current U_0/R
